Question: 小明用了4分钟做了35道计算题，平均每做一道题大约要用_____分钟（Xiaoming spent 4 minutes doing 35 calculation problems. Approximately how many minutes did it take to do each problem on average?）
Solution: 用总时间除以计算题道数即是平均每道题用的时间，算出结果，再求出近似数。4÷35≈0.11（分钟），故答案为：0.11 (Divide the total time by the number of calculation problems to get the average time per problem, calculate the result, and then find the approximate number. 4÷35≈0.11 (minutes), so the answer is: 0.11.)
Student's Scratch Paper
Correct Answer
0.11
Student's Answer
8.75

Task II: Error Cause Classification
Answer 1
Problem Comprehension
Answer 2
Calculation
Task I: Error Cause Explanation
The student reversed the order of the division operation, dividing the total number of problems (35) by the total time (4 minutes), instead of dividing the total time (4 minutes) by the total number of problems (35).)
Answer 1
When the student was calculating 4 ÷ 35, due to a lack of proficiency in decimal division, they mistakenly moved the decimal point two places to the right during the calculation process, erroneously changing the quotient 0.11 to 11. Afterward, due to some computational or conceptual confusion, they ultimately obtained 8.75, a result that is far from the correct answer. This primarily reflects the student's weakness in decimal calculation skills.)
Answer 2
Human Annotation
Ground Truth
Matching
Calculation error
Team of Experts
The student mistakenly divided 35 by 4 instead of 4 by 35, getting 8.75 instead of the correct 0.11.
